

Flying Safely as an Older Pilot (For Credit Only)

Age-related changes in cognitive functions essential for flight include perceptual processing, some aspects of memory, and psychomotor control. Cognitive functions not clearly affected by age involve information processing, problem-solving, decision-making, and time-sharing. Pilots must be able to assess the possible negative effects of aging. Join us as we offer recommendations for the older pilots.

The seminar will be held in the Univair Forums Tent
