

FAASTeam presents:

# Cross Country Flight Planning-Hybrid Event

Stage Check Instructor Graham will review the most common topics he sees students falter on during stage checks, flight reviews, and advanced training. Using his insight into commonly misunderstood knowledge areas, he will guide you on your way to becoming a better pilot by digging deeper into fundamental aspects of flying safely. Mastering these weak areas will increase your confidence and propel you forward in your aviation career. Feel confident walking into your checkride or enjoy a thorough refresher toward your flight review.

Topics include Preflight planning: How does a change in CG affect load factor and thus performance and stability? What is  $V_a$ ? Why does it change with aircraft weight and why does it matter? What is the difference between TAS, IAS and Ground Speed, and why does it matter for navigation planning? What are the most common misunderstandings when dealing with inoperative equipment?

XC planning: What is the difference between TAS, IAS and Ground Speed, and why does it matter for navigation planning? Deciding to divert, what's the best process? What is the most common mistake on a diversion? Why should flaps be used or not used in gusty/windy/turbulent
